Serial No.: 10/552,160 Amendment dated Aug. 7, 2009

Reply to OA of May 13, 2009

IN THE SPECIFICATION:

Page 14, lines 18 to 30, replace the paragraph with the following

amended paragraph.

Figures 4A-D show a third exemplary embodiment of a laryngeal mask

according to the invention and being essentially identical with the

exemplary embodiment shown in Figure 2, but wherein the peripheral cuff

9 of the mask portion 3 comprises at least two inflatable lateral bellows

12 that are arranged on the top face 4 of the mask and being essentially

in parallel with the major axis of the generally elliptical cuff 9. Like

above, it serves the purpose of ensuring a closer abutment of the mask

portion 3 around the laryngeal opening during use of the mask 1, the

lateral bellows 12 abutting on the wall of the pharynx opposite the

laryngeal opening. Simultaneously passages (qullies) 4a are formed

between the lateral bellows 12 and the upper face of the mask portion 3

that allow vomit, if any, to pass the mask portion. Thereby it is

prevented that vomit, if any, displaces the mask portion 3 or parts

thereof.
